

RESEARCH PROGRESS REPORT SUMMARY

Grant 01760-T: Use of Gene Therapy to Treat Dilated Cardiomyopathy

Principal Investigator: Margaret Sleeper, VMD
Research Institution: University of Florida
Grant Amount: \$146,774.00
Start Date: 9/1/2016 **End Date:** 8/31/2023
Progress Report: End Year 8
Report Due: 2/28/2023 **Report Received:** 3/15/2023

(The content of this report is not confidential and may be used in communications with your organization.)

Original Project Description:

Dilated cardiomyopathy (DCM) is the second most common cause of heart disease in dogs, and medical management of the secondary signs is the only therapeutic option. The outcome for affected dogs depends on the stage of disease and the breed. Once diagnosed, dogs typically exhibit rapid and uniform progression to congestive heart failure (CHF), with most living less than 6 months. Previous research has shown that heart function is critically dependent upon calcium channel function. These gate-like channels found within the wall of cardiac muscle cells open and close, allowing calcium ions to flow into the cell. Calcium influx then regulates muscle contraction. Heart disease is strongly associated with malfunctioning calcium channels within cardiac cells. Gene transfer strategies to reduce calcium cycling abnormalities improve heart function in animal models as well as in human clinical trials. In this study, Dr. Sleeper will conduct a placebo-controlled, double blinded study to evaluate gene delivery approaches for treatment of Doberman Pinschers affected with DCM and CHF. If results show that the gene delivery slows progression of heart failure in Dobermans with DCM, the results will have significant ramifications for all dogs with heart disease, as calcium handling proteins are abnormally expressed in dogs with heart disease of varying causes.

None at this time.

Presentations:

None at this time.

Report to Grant Sponsor from Investigator:

To date, 23 dogs have been screened for enrollment in this study, ten dogs have undergone treatment (enrolled), three have died after enrollment in the study but prior to treatment and ten dogs have had vector antibody titers too high to safely treat. One dog is scheduled to be treated the third week of March. We continue to advertise the clinical trial by various methods in order to meet our goal of treating 12 dogs.
