

RESEARCH PROGRESS REPORT SUMMARY

Grant 02783: Transcriptional Profiling of Canine Soft Tissue Sarcoma

Principal Investigator: Andrew Miller, DVM
Research Institution: Cornell University
Grant Amount: \$132,759.00
Start Date: 3/1/2020 **End Date:** 2/28/2023
Progress Report: FINAL
Report Due: 2/28/2023 **Report Received:** 4/26/2023

(The content of this report is not confidential and may be used in communications with your organization.)

Original Project Description:

Soft tissue sarcomas account for 10-15% of all skin and subcutaneous cancers in dogs. Traditionally, biopsy and subsequent histology have been the primary means of diagnosing these cancers. The histology is assigned to one of three grades ranging from low (grade I), intermediate (grade II), and high (grade III). Histologic grade is currently the key criterion for guiding treatment and determining patient outcome. However, in human medicine and pathology, soft tissue sarcomas are diagnosed with a hybrid approach that involves both histologic features and genetic analysis of the tumor sample. This genetic analysis guides further treatment, aids in developing accurate follow-up information, and has been shown to have a positive effect on patient outcome and survival. Despite how common soft tissue sarcomas are in the dog, current veterinary care still relies solely on the histologic grade, which is subjective at best, and does not incorporate genetic data into the diagnostic plan. This study will perform transcriptome analysis on 300 canine soft tissue sarcomas in order to establish the transcriptome profile of canine soft tissue sarcoma and correlate this transcriptome to patient follow-up. This will allow for the formation of a hybrid diagnostic approach that will provide more accurate information to inform the prognosis for dogs afflicted with soft tissue sarcoma.

Publications:

None at this time. We plan to begin drafting a manuscript later in 2023.

Presentations:

We are preparing submission of an abstract and oral presentation to the 2023 American College of Veterinary Pathologists annual meeting (Fall 2023).

Report to Grant Sponsor from Investigator:

Soft tissue sarcoma (STS) encompasses a number of neoplasms that are derived from mesenchymal cells including fibrosarcoma, myxosarcoma, hemangiopericytoma, and undifferentiated sarcoma. In the dog, STSs arise frequently in the dermis/subcutis and represent up to 15% of the neoplasms in this location. Our primary aim of this grant was to collect cases of canine STS for histologic and gene expression analysis which we have completed. During all three years of the grant, we had excellent recovery rates from formalin-fixed tissue and have begun to generate sequencing data that can be layered onto the histologic findings and patient demographics.
